

PharmiSage

INVENTORY
OPTIMIZATION

PharmiSage solves the problem of stale high-value chain inventory

With PharmiSage, stores that now are obliged to order from a traditional distributors will now have the option to “buy” from their own inventory.

PharmiSage assists chain pharmacies to achieve true network inventory optimization by augmenting the one-to-one distributor relationship with an internal marketplace for slow moving, short-dated and split-pack stock.

As an extension to the Pharmitas Portal, PharmiSage’s web interface and connection to existing datasources minimizes staff interaction to essential

tasks without requiring a costly and time consuming integration initiative.

Through its latticed view of store inventory, PharmiSage eliminates the following challenges often found in a multi-pharmacy environment:

- Stores carry redundant safety stock inventory.
- Customer service failures occur even when adequate inventory exists at other chain locations.
- Pharmacies experience undesirable stockouts.
- Excess inventory is created when products are ordered to fulfill an immediate customer need even though they exist at other chain locations.

- Shortsighted internal allocation decisions are made for products with limited availability.

At a glance:

- Reduce dependency on traditional drug distribution by maximizing the use of existing inventory
- Increase working capital, prescription sales, and customer satisfaction
- Decrease inventory waste and reverse distribution

Compatible with:

- EnterpriseRx
- PDX
- PharmacyRx
- Pharmaserv
- Condor
- DataStat
- Renlar
- Zadall
